

Creating users, brands and admins

For the platform owner (super admin) and whoever operates the server. It covers how each kind of account comes into existence, and the manual procedures that have no screen yet.

Account	Who creates it	How
User (carpenter, contractor, customer)	The user, themselves	Scan QR → verify phone by SMS → profile
Brand (tenant)	Platform owner	SQL today; a command is planned
Tenant admin	Platform owner	<code>npm run admin:create</code>

Commands below run from the project folder with the server's environment (`.env` locally). In WSL, load Node first with `. ~/.nvm/nvm.sh`.

1. Users (self-service)

Nobody creates users by hand. A user account is created the first time someone:

1. scans a brand's QR code (`https://<domain>/t/<brand-slug>/scan`),
2. verifies their phone with the SMS code, and
3. enters their name and category on the profile screen.

Rules:

- **A user is one phone number in one brand.** The same number in two brands is two separate accounts with separate points.
 - The phone number is the identity. There is no email or password for users.
 - Users cannot change their phone number. A new number is a new account; an admin can move points between the two with adjustments .
 - A brand must have at least one **category** in its settings before anyone can finish the profile screen.
 - **Not supported yet:** deleting a user or changing a user's phone number.
-

2. Brands (tenants)

Each brand has a **slug**, the short name in its URLs. It is permanent, because it is printed in QR codes.

- Use lowercase letters, numbers and hyphens: `acme-plywood`.
- QR code URL: `https://<your-domain>/t/acme-plywood/scan`
- The app also opens at `https://<your-domain>/t/acme-plywood/`

Local development

`npm run seed` creates two demo brands, `demo` (wood theme) and `demo-laminates` (teal), each with default settings and 3 rewards. It is safe to run again. Do not run it in production.

Production: creating a real brand (today)

```
INSERT INTO tenants (slug, name) VALUES ('acme-plywood', 'Acme Plywood');
```

Step 2. Set it up in the admin panel as a super admin: choose the brand in the selector at the top, then:

1. **Settings:** brand name, tagline, logo URL, colours, and at least one **category** (required for sign-ups). Scan and points rules start at the defaults (10 points per scan, 10-minute cooldown, 5 scans a day, 60-day expiry, 30-day vouchers).
2. **Rewards:** add the rewards with their points cost and stock.
3. Optional: per-brand MSG91 sender ID and template ID. Blank uses the server defaults (`MSG91_SENDER_ID`, `MSG91_TEMPLATE_ID`). The brand's SMS template must be approved on DLT; see the README.

Step 3. Create the brand's admin (section 3 below, role `tenant_admin`).

Step 4. Print the QR code with the URL `https://<your-domain>/t/<slug>/scan`. Any QR generator works; the platform does not generate QR images.

To take a brand offline: `UPDATE tenants SET active = false WHERE slug = 'acme-plywood'`; its pages and APIs then return "not found", and it disappears from the admin panel. Data is kept.
